Assignment – 2.12

Other Protocols in Action

Q - 1. Install FileZilla Server on your Windows machine, create a user account, and set up a shared folder for FTP access.

- **Install FileZilla Server and Create User Account:**

1. Download FileZilla Server from Official website.
2. Install and open FileZilla Server.
3. Go to **Users → Add**.
4. Create a username and password.
5. Create a folder named FTP_Shared.
6. Add this folder to the user's shared folders.
7. Give **Read and Write** permissions.
8. Click **Apply**.

- **Result:**

FileZilla Server was installed, an FTP user was created, and a shared folder was configured successfully.

Q - 2. Use FileZilla Client to connect to your FTP server using the credentials you created, and upload any image file from your computer to the shared folder.

- **Upload Image Using FileZilla Client:**

  1. Open **FileZilla Client**.
  2. Enter Host: 127.0.0.1, Username, Password and Port: 21.
  3. Click **Quickconnect**.
  4. Select an image from the left side.
  5. Open the shared folder on the right side.
  6. Right-click the image and click **Upload**.
  7. Verify the image appears in the shared folder.

- **Result:**

  Successfully connected FileZilla Client to the FTP server and uploaded an image file to the shared folder.

Q - 3. Download the uploaded file from your FTP server to a different folder on your computer using FileZilla Client, and verify the file size matches the original.

- **Download File Using FileZilla Client:**

1. Open **FileZilla Client**.
2. Connect to your FTP server using your username and password.
3. On the right side, open the FTP shared folder.
4. Find the uploaded image file.
5. On the left side, select a different folder on your computer.
6. Right-click the image and select **Download**.
7. After downloading, right-click the original and downloaded files and select **Properties**.
8. Compare their file sizes.

- **Result:**

The file was successfully downloaded, and both file sizes matched.

Q - 4. Research and list 3 real-world scenarios where SNMP is used in network management for apps or services you use (such as ISPs, campus WiFi, or large websites). Hint: Think about how network admins monitor device health, bandwidth, or uptime.

- **Real-World Uses of SNMP:**

No.	Real-world scenario	Use of SNMP
1	ISP	Monitors routers, bandwidth, and internet connectivity.
2	Campus Wi-Fi	Monitors Wi-Fi access points, connected devices, and uptime.
3	Large Websites / Data Centers	Monitors servers, CPU usage, bandwidth, and network health.

Q - 5. Create a table comparing FTP and HTTP across at least 5 points: port number, security, data transfer method, use cases, and authentication.

➢ **Difference Between FTP and HTTP:**

Points	FTP	HTTP
1. Port Number	20 and 21	80
2. Security	Less secure	Less secure
3. Data Transfer	Transfers files	Transfers web pages
4. Use	Upload and download files	Open websites
5. Authentication	Username and password	Usually no login required
6. Connection	Uses two connections	Uses request and response
7. Secure Version	FTPS / SFTP	HTTPS
